Inhaled Chlorine & Ammonia-TAFA 400

Luminec Corporation

Memorandum

On or about April 15, 2011 while conducting some routine heavy cleaning activities, I accidentally had a spill and an unfortunate inhalation of gaseous Chlorine and Ammonia.

The inhalation of these two caustic vapors caused burning of the nasal and oral passages all the way down to the larynx and esophagus. The burning inflammation was quite severe and damage to the larynx and esophagus was also evident because swallowing was very difficult. Speaking was virtually impossible because the larynx was only capable of generating some high pitched squeaks. This effort was also very painful.

I immediately went to the laboratory and got a spray bottle of TAFE 400. I sprayed it liberally into the nasal passages and that burning pain subsided immediately. I then opened the spray bottle and took a mouthful of the TAFE 400 (about three table spoons) and gargled for about two minutes. Again the relief from the burning pain was virtually instantaneous. Later in the day I gargled a similar amount of TAFE 400 and inhaled the TAFE inhalant. In both gargling episodes, after I was through I swallowed the solution to coat the esophagus. The following day there was no trace of inflammation or damage.

On that day I went to an Eye, Ear, Nose and Throat specialist and after his examination he advised that there was no visible damage to the involved organs.

Two weeks later there were no after effects.

FR: Ann Waesche

RE: Synopsis of Success of the Utilization of TAFE 400 with Hair Transplant Clients

This client's results with TAFE 400 used in his post-operative care following hair transplantation surgery, demonstrates the typical success we have experienced with many like cases where TAFE 400 was substituted for previously utilized products. Every client experienced significantly less post-operative problems overall with the TAFE 400 product as compared to previously used products. It was tested on more than forty clients over a ten-month period. Some of these cases were excluded from reports to Luminec either because they were not photo documented or the client failed to report for their follow-up visits to the clinic. However, these patients were contacted by phone and all reported no problems and excellent post-surgical results.

Each client was given a two ounce spray bottle of TAFE 400 and instructed to spray the transplanted grafts and the donor area twice daily. The first application was given by the technician post-operatively and at the twenty four hour post-operative visit. The client was then instructed to spray the affected areas twice daily after wound and hair cleansing. Although the quality of cleansing done by clients varied individually and could not be controlled or measured, the post-surgical results provided by TAFE 400 utilization were consistent. Overall results in the test group were very positive and the main benefits of using TAFE 400 to enhance the post-surgical hair transplant process were easily documented.

Prior clients who post-operatively used products other than TAFE 400 would occasionally experience infections of the surgical incisions and graft areas. Although relatively uncommon, infection of the surgical incisions could result if the patient did not follow hygienic directions carefully. This would lead to many further office visits, more prescription antibiotic use, and an increased amount of clinician time spent with post-operative clients either by phone or in person. Post-operative clients are generally anxious about the results anyway, and avoiding problems is the goal whenever possible. We were very pleased to see the antibiotic-like properties of TAFE 400 virtually eliminate any infection problems from appearing in the test group.

Other commonly associated problems for these clients include swelling and bleeding in graft and donor site areas. This is relatively common the first few days after surgery. Swelling in the donor and recipient areas is the most common post-operative complaint. Swelling is expected to occur after any incision, and in hair transplantation surgery there are often 1200 or more incised areas for the grafts on the scalp, as well as a large donor area incision in the occiput which is closed with sutures.

Adding to the insult of the tissue is the injection of medications into the scalp, and this coupled with the incisions, leads to many frequent complaints of swelling of the scalp. With the use of TAFE 400, minimal or no

swelling was noted in almost all cases. This may be the result of the rapid, enhanced healing from the use of TAFE 400. This was especially impressive since swelling is the most common post-operative problem.

Post-operative bleeding is not usually an issue for most clients, but TAFE 400 clients had no problems whatsoever with immediate post-operative bleeding. The graft and donor areas healed very rapidly as evidenced by faster scabbing of the incised areas than that noted in non TAFE 400 client groups. Again, this seems to indicate that TAFE 400 induces more rapid healing.

Although the appointments for follow up visits after the initial twenty four hour period varied, the TAFE 400 clients came back for at least two to three post-operative checks, usually at one week and two week intervals with additional appointments as needed. During these follow-up visits it was consistently noted that overall progress was rapid and with few problems presented. There was very little scarring noted in the TAFE 400 patients, which is significant since scarring can be an issue in both the donor and recipient areas. Overall healing times were greatly reduced by about one half compared to patients using other post-operative products. These scabs fell off more quickly than usual and the rapidity of hair growth from the newly transplanted grafts seemed to be greater as well. This may also indicate enhanced healing properties of TAFE 400.

Several TAFE 400 test clients had received previous hair transplants and had utilized other post-operative hair transplant products and thus were in a position to compare the difference. These clients told clinicians that within the first twenty-four hour period they noticed a significant change in their post-operative healing. They independently and voluntarily reported an overall more positive experience using TAFE 400 and continued to report excellent new hair growth well after the TAFE 400 had been discontinued.

The surgeon and the clinic staff were very favorably impressed with the TAFE 400 product for post-operative use in hair transplantation clients. The surgeon stated that the enhanced healing effects noted with TAFE 400 seemed to be the single most important reason for the favorable results. The clinic owners, also favorably impressed, have expressed a strong interest in being able to acquire more TAFE 400 for ongoing use in other hair transplant clients.

TAFA 400 Product Testimonials

David Schnaidt & Families

July 24, 2011

TO: Luminec Corporation
Steven R. Schutt
Greg Erickson

First and foremost, continued Happy 4th of July to both of you and thank for your patriotism and selfless service. I am honored and humbled to be associated with a wonderful company that has miraculous products and is comprised of a group of professionals with uncompromising integrity.

Second, I cannot thank both of you enough for the product samples you have provided our family. To say your products are miraculous is a serious understatement; words cannot describe what we have experienced after using your product.

I have included a few of our testimonies below and I am certain there will be more to come.

- 1) Ever since I began a regimen of Coumadin in 2009, irritating bug bites tend to be amplified on my body, and tick bites are undoubtedly the worst. When I have tick bites they swell to about 1/4 of an inch in diameter and burn and itch constantly. I recently found a tick attached to the lower middle part of my back. Although the tick had probably been attached for less than 2 hours, within 8 hours the "bite" area had swollen and became extremely irritated. The product samples you sent us arrived the next day and that evening my wife applied 2 drops of Tafa 400 to the affected area. I let the product absorb into my skin and completely dry before I went to bed. The next morning the bite area was almost invisible and there was no irritation whatsoever! I did not reapply any more Tafa 400 and the bite mark is now gone (within 7 days).

Over the past few years my wife has had some skin spots removed from her face. Her physician told her they could be precancerous lesions and it was best to have them removed. In late June she noticed two of these spots growing on her face so she applied Tafa 400 drops once per day to those areas. Within 3 days the spots began to shrink in size, and now, about 7 days later they are barely noticeable.

- 2) Our 4 month-old granddaughter had troubling bilateral eye infections. Over the 4th of July weekend she was suffering greatly and had a large amount of yellowish discharge from both eyes. The prescription medication her mother was putting in the infant's eyes was not effective. After days of my wife and I insisting that she try using the Tafa 400 on the child, my daughter finally allowed us to apply the Tafa product on the outside of the baby's eyelids, and we gently rubbed the product over one of her closed eyes. We tried to convince our daughter to put one drop of Tafa 400 in both of the baby's eye but she didn't feel comfortable doing so at the time. Last night (2 days after we applied the Tafa 400) our daughter called and was very excited because the baby's eye we had treated with Tafa 400 seemed to be clear of infection and had not had any discharge at all, while the other eye still had some discharge throughout the entire day. Our daughter decided to apply one drop of Tafa 400 directly into the baby's left eye which was the most problematic and that had not responded to the prescription medication. Within 24 hours the eye was clear and has been free of infection for the past 8 days.
- 3) Our youngest daughter found a common wart on her right hand and applied 2 drops of Tafa 400 on the wart approximately 10 days ago. The wart has all but disappeared.

4) I was suffering with gastroenteritis so I mixed one teaspoon of Tafa 400 with three teaspoons of purified water before going to bed and then again in the morning. My gastroenteritis was gone within 24 hours.

Thank you for providing us with these fantastic samples of your upcoming products that I am convinced will change the paradigm for health care as we currently know it.

Sincerely,

David Schnaidt

Kenneth Yasny, Ph.D.
Nutrition Works Clinic

Lupus TAFA 400

July 21, 2011

I placed one of my clients, Marjorie Lentz, on an oral regimen of TFA 400 and she also used the TFA in a spray bottle for her skin. This woman is 59 years of age and I would describe her as having multiple physical problems. Among them are: Lupus, depression, anxiety, Fuchs dystrophy, headaches, mitral valve prolapse, GERD, asthma, carpal tunnel syndrome, high blood pressure and blood sugar issues – plus a few others.

My thought process was to use TFA 400 to work on the root causes of her physical problems. Most of her problems are cellular inflammation and allergic related as well as blood ph. After the first day of ingesting TFA 400 she felt better and by the fifth day she reported, "It's a miracle." She has so much stress in her life that I get stressed and fatigued just listening to her. She is running on all cylinders now even though her responsibilities are overwhelming.

I asked her to make a synopsis of her health diary and send it to me so that she can share it with all of us. That synopsis appears below. She is not a wealthy woman, but she told me that if this product would not be available in the United States she would fly to wherever it was made and buy it. This is how much she believes in the product.

P.S.

I just received a new message from Marjorie - her Rheumatologist was shocked to find NO MARKERS in her blood for Lupus! I don't know if you've had a Lupus patient yet, but it makes sense that TFA 400 would help. You are doing amazing work out there for people!

Sincerely,

Dr. Kenneth Yasny

The following is the letter I received from Marjorie Lentz today, 7-21-11:

Dearest Luminec personnel,

First off, I want to say Thank You! I'm grateful, I'm blown away with my results, and no words can reflect the type of gratitude I have!

When I first came to see Dr. Yasny I had a host of conditions. This is only a short list of those problems:

I was overweight and suffered from lupus; I had bilateral problems with my hand, wrist, forearm and elbow that stemmed from overuse due to a congenital issue; I suffered from depression, anxiety, Fuchs dystrophy, headaches, mitral valve prolapse, GERD, asthma, bilateral work comp injuries in my upper extremities, neuropathy, hypoglycemia, osteoporosis, high blood pressure, etc.

I have been under a tremendous amount of stress for many, many years! Stressors include: parent issues, termination of marriage, relocation twice across the country, operations, neuropathy, family dynamics, significant health scares, and increased depression. This was before being introduced to TAFE 400 by Dr. Yasny who is helping me with these problems. Due to my enormous stress levels I had not been able to heal from the above conditions, nor had I been able to function in the way I need to in order to resume doing my daily tasks and activities. Immediately after I began taking the TAFE products, for the first time in six years, I had the ability to do my daily tasks. Not only that, I did not feel the need for a nap by the second day. I skipped many of my medications, probably because I didn't need them and my body told me so, and I felt more like myself – competent, energetic and positive.

Since May of 2011 I have reduced my medications tremendously and no longer require many of them.

Again, I so much appreciate getting the chance to utilize your products at this very difficult juncture in my life! As I told Kenneth, I would be willing to travel throughout the world extolling the virtues of these products!

I look forward to continuing with the TAFE products and doing the full protocol when my finances permit.

Thanks again,

Marjorie Lentz

P.S. Thank you! Thank you! And bless you all!

7/26/11

To Luminec Corporation:

I am relatively healthy at the age of 59 as I have always been very cognizant of my health. My practice is in the field of nutrition and I have followed my own advice for a long period of time. My main health related complaints are as follows:

I can't eat ice cream more than once a month without developing congestion and snoring; any trauma to a toenail often yields a bridge-like defect from the nail bed; and my energy and motivation levels are substantially less than they used to be.

After receiving my supply of TAFE 400 I began using the inhalant TAFE twice a day as directed. I also applied a small droplet of the liquid TAFE on my toenail bed to see if it could help with one toenail that was not in good condition. After applying the droplets to my toenail for 3 days I noticed a healthier coloration change. I also applied a tiny bit of the liquid to a split fingernail bed, another recurring and annoying symptom I've had all my life. The split in the skin on my hand healed within a day and a half – which is 100% faster than it normally heals.

The following week I decided to experiment and ate a pint of Häagen-Dazs ice cream. I then inhaled an extra dose of the TAFE. I noticed there was no reaction at all – no snoring at night and no congestion. The next week I decided to eat another pint of Häagen-Dazs ice cream and followed it up with an extra dose of the TAFE inhalant. Again I had absolutely no reaction whatsoever. This is 99.9% very unusual! Being an ice cream lover and feeling really brave, I decided to experiment a third time the following week. Once again I had no symptoms whatsoever! In the 40 years since changing my diet, I had no reaction to ingesting a milk product once a week over a three-week period of time. This had never occurred before and made a huge impression on me.

My assessment of what I had experienced led me to believe that the TAFE formula must be working efficiently on the cellular level to process metabolic wastes and other characteristics of milk products that cause allergic symptoms. After a period of two months without eating any milk products (cheese and ice cream are my favorites) I stopped taking the TAFE products for 5 days. Then one day I decided I wanted to have some ice cream. Unfortunately, I ended up having the same problems of snoring and congestion.

I obtained more of the TAFE 400 and proceeded to ingest 3 tablespoons in the morning and 3 tablespoons in the evening. I experienced some very subtle, yet powerful and relevant effects.

I believe the TAFE 400 has killed all the harmful parasites throughout my gastrointestinal system. I had not changed my diet, yet my level of abdominal distention decreased. I ran an

experiment to confirm my suspicion that the TAFA had killed organisms throughout my entire gastrointestinal system, including my large intestine. I stopped taking my probiotic and after 3 days my elimination had changed, and after 10 days I had no elimination. Skipping one day is not tremendously significant; however, I actually went a full 3 days without any bowel movement or any indication that I needed to evacuate. This is tremendously significant! I've not gone 3 days without a bowel movement in over 40 years since I started changing my own diet and nutrition levels. I took one dose of my probiotic that night and had an elimination the next morning. I avoided taking the probiotic the next day and sure enough, I had no elimination again for 3 days. This is not only unusual and out of the ordinary, but I haven't had this experience since my early days of battling bowel dysfunction. My first assumption is that TAFA 400 must not distinguish between friendly bacteria and harmful bacteria – it just kills all of them. I believe parasites are a tremendous problem for our human bodies – more than medical science will admit. I find it is a boon to be able to kill all organisms throughout the intestinal track and then easily replenish the friendly bacteria like bifidus and acidophilus. Without any change in diet, and simply going back to taking my probiotic, I have become my usual regular self.

A week after returning to normalization I resumed my TAFA 400 treatments and immediately began to feel more energy in my body. On the third day I experienced a level of well being that I haven't felt since my mid 30's. For me, this was a highly significant change! I hadn't changed my diet, I hadn't changed my supplementation – the only thing that had changed in my life was my ingestion of TAFA 400. To me this was an indication that the TAFA molecules were significantly changing the way my 75 trillion cells were working and was keeping them in a hydrated state with less inflammation than I had experienced in many years! Thank you for introducing me to this incredible product.

Right toe after 2 weeks of TAFA 400 treatment

Left toe after 2 weeks of TAFA 400 treatment

Dr. Kenneth Yasny

William LoBell
Personal Evaluation Tri-Amino-TAFA400

William LoBell Testimonials

To: John Everding and Steven Schutt

July 28, 2011

TAFA 400 Inhalant:

Over the years I have used a variety of nose sprays including Afrin products to relieve my blocked nasal passages. Afrin only provided me with temporary relief. The more I used it, the more it caused nasal irritation. I have used other sprays made of salt solutions but find them not only ineffective, but the solution always found its way down the back of my throat which was very distasteful. Before retiring for the night I used the TAFA 400 inhalant. I could feel it working immediately. I woke up the next morning and the nasal passages were still open. This continued for the entire day. I did not experience any negative effects, irritations or taste issues. I now use TAFA 400 inhalant once a day. Thank you so much for a product that works so well.

TAFA 400 Spray:

While taking a walk with my wife at dusk, she noticed that a mosquito had landed on the top of my head. We see a lot of mosquitoes since we live close to a lagoon. By the time we returned to our home I felt an itching sensation on the top of my head and a huge lump resulting from the mosquito bite. I applied the TAFA 400 spray and after a few minutes the itching stopped. I applied TAFA 400 a few more times and by the next morning the lump was reduced by 75%. By the end of that day it was gone. In the past a mosquito bite would usually have taken well over a week to heal. I was impressed that the TAFA 400 not only removed the pain of the bite but also healed it so quickly.

TAFA 400 Drops:

My regular exercise program includes the use of weight machines. While I have enjoyed the use and the benefits of these machines it has resulted in constant aching in both of my shoulders. At times I struggled to raise my arms above my head because of so much pain. I reduced the level of weight that I was using but the aching continued. I visited a variety of doctors and it was recommended that I reduce the number of days that I use the machines, reduce the weights, and take a few Advil after each work out. Doing less exercise and masking the pain with Advil just didn't seem right to me. Having seen the healing results of the TAFA 400 products with other ailments and knowing that it was as safe to use as distilled water, I started adding $\frac{3}{4}$ of a dropper of TAFA 400 to one 16 ounce bottle of drinking water daily. I continued my weight machine routine and was able to increase the number of days that I used them. After a month of using TAFA 400 my shoulders were pain free without the use of Advil and I was enjoying my workouts again. I'm really excited about the results from TAFA 400 and look forward to using any other products that you may be developing in the future.

TRI AMINO DROPS:

I wanted to give you an update on the results that I have experienced using your Tri-Amino. It was so simple to apply and the results were fantastic. As you suggested, I applied a light coating of Tri-Amino on my entire face before retiring for the night. My normal nightly routine is to wash my face and brush my teeth. I will admit that in the past I tried to use a few facial treatments that promised to produce smooth skin. But the process of using these commercial products was so elaborate and the results were so little that I finally gave up on them. Using Tri-Amino has enhanced the color and texture of my skin. It now appears very soft and smooth, and many of the fine lines have disappeared. I started seeing immediate results in less than a month! Each day I see additional improvements to my skin. I highly recommend Tri-Amino based on my own results. This product will be revolutionary in the cosmetic industry!

Sincerely,

William LoBell

Testimonials

July 28, 2011

Dear John S. Everding and Steven R. Schutt,

I normally do not send testimonial letters to companies about their products, but after using your TAFE 400 products and experiencing such outstanding results, I wanted to ensure that other customers would be aware of your wonderful products.

TAFE 400 Alert Inhalant:

During the mid-day time period, I normally find myself feeling fatigued. In the past I have stopped and purchased a cup of coffee to boost my energy level, but after an hour the fatigue returns. Your TAFE 400 Alert inhalant has become the perfect solution to my mid-day dilemma!

As soon as I start feeling a little sluggish, I use my TAFE 400 Alert. Within five minutes I feel totally refreshed; and even more exciting, this feeling continues for up to 2 – 3 hours! No more mid-day coffee breaks for me. I now keep my TAFE 400 Alert in my car and in my purse. I recommend the TAFE 400 Alert to anyone that wants to maintain a high energy level for business or personal events.

TAFE 400 Drops:

One morning during breakfast I noticed that my husband kept glancing over at me. He then commented on how my skin had a beautiful glow and smoothness to it. He then asked why I had already applied my makeup so early knowing that I usually did it after breakfast.

I told him that I had not applied my makeup yet. He continued to talk about my skin texture and I finally confessed that I was applying his new TAFE 400 drops on my face at night. I told him how excited I was about the TAFE 400 results since all of the other products that I had used in the past performed below my expectations. Applying the TAFE 400 drops only takes a few minutes but the results last forever!

TAFE 400 Drops:

I must share with you an incident that occurred during breakfast a few mornings ago. I had placed a large cup of coffee into the microwave to reheat it. When I went to remove it, I knocked the cup over and all of the hot scalding coffee drenched my entire hand. I was really in extreme pain and called for my husband to help me. He came running in and the first thing that he did was grab the bottle of TAFE 400 that we keep in the pantry. He applied TAFE 400 over my

entire hand and between my fingers, and within moments the pain stopped. My hand was bright red and we were both concerned that the burn would develop into blisters and take weeks to heal. To our amazement, that evening the redness had started to lighten and I was still without pain. By the next morning my hand was completely healed without any evidence of the accident.

The TAFA 400 products are the most revolutionary products that I have ever seen in my life! Thank you so much for supplying us with these scientifically proven products.

Sincerely,

Beverly LoBell

July 27, 2011

Patient: Karen Blindt Age 63

Condition: Sinus, viral infections, vision problems.

This patient was placed on a 4-day trial of oral TAFA 400 for sinus and respiratory issues. We plan to use a 30-day nebulizer protocol on her in the near future.

Here is her testimonial in a letter sent to me today:

Dear Dr. Davis,

In the early part of May I caught a virus from one of my students at school that affected my near point vision and made it very blurry. I had to use a pair of non-prescription reading glasses in order to see correctly up close. You instructed me to take one tablespoon of TAFA 400 orally for the next four days, at bedtime.

May 8-11, 2011. After taking the TAFA I noticed that I couldn't see correctly with my prescription bifocals any more, for both near and far point vision. I actually saw better without the use of my prescription glasses or the reading glasses.

I had my annual appointment with my eye doctor, Dr. Klesken, on June 15, 2011. She told me that I needed a new prescription! That's why I couldn't see correctly when wearing my old prescription glasses.

I then proceeded to tell her about the TAFA 400 treatment you prescribed for me. She was very interested to say the least! After the exam, she shared with me that she had never seen this happen in her career. My vision in both eyes improved by 3/4 diopter and that's why I couldn't see correctly with my glasses. She said that's like my eyes improving by 3 levels! Needless to say, we were both very impressed!

I'm sending you a copy of the Dr. Klesken's report with my test results from 2010 and 2011 for comparison.

Thank you Dr. Davis for prescribing Tafa 400 for my blurry vision! Who knows how long my vision would have been negatively impacted from this virus...or if it would have become permanent. The Tafa 400 not only corrected the blurriness, but it improved my vision tremendously!

Sincerely,

Karen M. Blindt

The Tafa 400 had an awesome impact on this woman's viral condition in a very short time. This product appears to be an excellent antimicrobial agent that rapidly allows the body to heal itself and return to normal function. It has not shown to have any side effects on this patient.

Respectfully,

A handwritten signature in black ink, appearing to read 'Dr. Randall Davis', with a stylized, flowing script.

Patient: Vern Hunt

Condition: End Stage COPD. See earlier testimonial for detailed description of the original trial. The following is an update of his current status:

Several months ago Mr. Hunt was placed on a trial program for approximately 3 weeks. Unfortunately there was only so much product available at the time of the study, so this was meant to be a limited study of the affects of Tri-Amino and TAFA 400 on COPD over a short duration.

He used a nebulizer and took the TAFA 400 orally. No IV's were used. He used a little of the Tri-Amino at first then switched to TAFA 400. The results were remarkable at the time. His peak flow scores doubled, his need for oxygen was reduced, and he was walking better and was able to go farther without stopping to catch his breath. His pulse oxymetry numbers were better. His quality of life was improving and his own pulmonologist even said he looked better with healthier coloring. Less wheezing in the lungs was also noted. He was pleased with the results.

After the trial ended he started to regress. He has battled bouts of pneumonia and was placed in the hospital and lung rehab facilities. He has not been home in approximately 30-45 days. He is on oxygen 24/7. Lately he has been hospitalized for what was described as aspiration pneumonia. He probably went 2-4 months without taking the TAFA 400. His doctors at this point are describing a severe chronic condition and are unsure if he will ever return home. Our goal is that he does return home.

While in lung rehab, he began taking the TAFA 400 about one month ago using limited oral doses (maybe a tablespoon per night). He felt this has helped him regain some function. He was released to go home last week but again acquired pneumonia, which put him back into the hospital after one day at home. Today, I understand he was looking better and acting like the old "Vern". His color was better. He has still been using the TAFA nightly. Tomorrow he is being transferred to another hospital facility. We expect that in the next 2 days we will have permission to use TAFA 400 in a nebulizer, in a hospital setting. I will arrange for him to use TAFA 2x per day for 2-4 weeks. As he

improves we will consider reducing that frequency. He will stay on his usual meds as well. We will also increase his oral dose to 2-3 tablespoons at night, with a probiotic in the morning. He has passed the swallowing test which means he no longer needs to drink only thickened fluids. This was a concern recently because of the frequency of these bacterial infections.

I believe that ongoing use with the nebulizer would absolutely help to turn this patient's condition around and that TAFA 400 is a great substance for repairing/healing the lungs.

Respectfully,

A handwritten signature in black ink, appearing to read 'Dr. Davis', with a stylized, flowing script.

Patient: Gittel Hunt

This is an update on the condition of my patient Gittel Hunt. She has been suffering from mild to moderate asthma, and constipation. She also has chronic back pain from injuries sustained in a motor vehicle accident. She is a former holocaust survivor, spending most of her first year of life in a prison camp.

She has stated that the regular use of TAFE 400 orally has significantly helped her constipation. She states that when not taking the TAFE for a while her bowels get very sluggish again, reducing her to one bowel movement per week at times. She has also been under tremendous stress lately, which has aggravated her condition.

She also used a nebulizer for a brief period of time, about 2-4 weeks, and did see significant improvements in her asthmatic condition. The pain has not changed much as a result of her limited use of the product.

My opinion would be that regular usage at proper doses would certainly encourage a return to a more normal state of function of her GI tract. Over time, I believe that the doses could be reduced or discontinued once restorative healing has taken place. At this time it is unknown how long she would have to be on a regular program to achieve normal function. I also believe TAFE 400 to be the supreme substance, at this point in time, to treat lung conditions such as asthma. There have been no reported side effects with TAFE. I believe this product to be entirely safe to use orally, topically, for ingestion into the lungs using a nebulizer, and even in an IV form.

Respectfully,

Dr. Randall E. Davis, D.C., C.C.S.T

Jainice Ellman

Age: 67

Condition: Psoriasis. Location: right and left elbows.

The patient presents with chronic bilateral psoriasis, nearly identical in shape and size. The lesions are very dry and itchy. There is significant areas of redness whitening of the skin with dry, scaly patches, very indicative of psoriasis.

Patient was treated topically on the right elbow only. She began using a small amount of triamino solution, once – twice daily. Some days only once. She had a total of 5 ml to use. She then began using the Tafa 400 only. Again just on the right elbow. Small amounts were used, just enough to saturate the tissue. Patient probably used 3 ml of solution at the time of these photos. (See below). No other treatments were offered during the use of Tafa 400. Total treatment duration at this time would be 11 days.

The elbow being treated is noticeable smaller in size with skin color turning normal around the outer edges of the original lesion. It is still very dry and itchy. The other elbow was treated with an OTC topical lotion to control the itching. There is a temporary change in the dryness, but still appears very red. The left elbow is not healing, when compared to the right. There looks like a definite healing.

Center for

Holistic
Medicine

7/06/2011

Patient: E.B., Age: 71

Condition: Lymphoma of the Spleen

This is a patient with a large constellation of symptoms that have been chronic for approximately 25 years. She has been plagued by chronic fatigue, chronic pain, and significant emotional distress. Her blood work for the last 20 or so years has suggested the most likely diagnosis of lymphocytic leukemia. She has had chronically elevated WBC, with ongoing anemia that has been very hard to control. Over the last several years her spleen enlarged to a dangerous size and it eventually began to outwardly protrude from her body. She has managed to live a somewhat normal life, but was always very tired. She has been on a regimen of supplements and herbs, and is undergoing several diverse alternative treatments, including acupuncture, chiropractic, and emotional work. She has been on anti-depressants and other meds as needed along the way.

Approximately 2 years ago she was examined by a new oncologist who diagnosed her as having Lymphoma of the Spleen. Subsequently, she underwent chemotherapy and her spleen has been reduced in size by about 80 % and her lymphocytes are now under control. Her Hg and iron have also improved. However, she has had a significant increase in pain since the chemotherapy and suffers from continuing fatigue. She has also gained approximately 30 pounds.

We felt this would be a great opportunity to try the Tri-Amino and TAFE 400 protocol after her major chemo intervention. She completed a 30-day nebulizer protocol and a 30-day oral TAFE 400 protocol. She has also undergone 15 intravenous treatments with TAFE 400. She has continued to use TAFE 400 orally at night (3 tbsp.) with a probiotic in the A.M. We are now preparing to enter phase 2 which will encompass a minimum of 6 Tri-Amino IV infusions, up to a total of 14. She will also begin taking 3 tbsp. of Tri-Amino orally in the A.M. and continue taking 3 tbsp. of TAFE 400 in the evenings for 30 days.

She has noticed some interesting effects since beginning these protocols:

She stated that she has started to lose some weight. She also has more energy, and although it is sporadic in nature, it is definitely improved. She tolerated a trip to the east coast in the last week that

was very stressful and physically exhausting and she was able to handle it much better than she had anticipated. She really felt that the TAFE 400 had helped with her ability to be more functional. That is a huge win for her. She is just starting to notice that she is better able to manage her pain, as it is less severe compared to the difficulty she had following her chemo treatments. She also stated that she feels different emotionally (she can be very worried about things to the point of being obsessive). Zoloft did help somewhat, but she constantly felt drugged and indifferent to things in a negative way, and didn't really like having to be on the meds. She now feels as if things don't bother her to the same degree and she doesn't obsess or worry so much. She is enjoying that. I had no idea the Tri-Amino and TAFE 400 protocols could affect her mood to the degree it has. She has not changed anything else in her routine that we would not already have been doing, other than the addition of one or two MFR (myofascial release) treatments. Her emotional changes were occurring before the start of the MFR treatments, so I really have to credit that to the TAFE 400.

We also tested her cholesterol recently to compare with the levels prior to her taking TAFE 400. Pre TAFE cholesterol was taken in April of 2010. At that time, her triglycerides were 94 and the HDL's were 10. This is a 9.4:1 ratio of triglycerides to HDL. (Medical authorities really look at triglyceride to HDL ratios when determining an individual's risk for heart attacks and strokes, etc.). A 1:1 or 2:1 ratio is considered good and safe. The higher the ratio, the worse it is. Her being at 9:1 was considered dangerous and a significant risk factor for heart disease. This would also be related to a chronic and significant amount of inflammation within the body. However, after undergoing the TAFE 400 protocol, including at least 8 IV treatments, her HDL's went up 35 points and are now at 45. Her triglycerides also were actually considered too low and went up approximately 8 points. The ratio now is about 3:1.

I will be providing more blood work and other diagnostic data as it comes in.

I would say at this early stage of use, the TAFE 400 could prove to be extremely important in post cancer treatments to help the body achieve normalization of tissue and function.

Respectfully,

A handwritten signature in black ink, appearing to read 'Dr. Davis', with a long, sweeping horizontal line extending to the right.

Center for

Holistic
Medicine

July 26, 2011

Patient: Debra Holden on January 12, 2011

Height: 5' 8" Weight: 125

This patient complains of numbness in her legs and arms and into the hands as well. She has difficulty gaining weight. She also complains of weakness in the right leg. The numbness extends to the big toe on the right foot. She also complains of numbness in her face. She has had moderate to severe fatigue during this time as well, often resulting in having to significantly modify her physical activities, including taking care of her family, household chores, and participating in recreational activities. In addition, she has moderate, intermittent back pain throughout the entire spine. She has a significant amount of spasms and subluxations. This has been going on for approximately 11 months. She has tried numerous treatments in the medical realm, and has seen neurologists and

other specialists who have ruled out structural reasons for all of her numbness and discomfort. Her MRI and neurologic workup just did not support structural dysfunction as a basis for the numbness. The feeling from the medical community was that she possibly had a systemic infection. They have all 'thrown up their hands' as far as offering a treatment solution that would help her.

Remarkable blood test results: High normal eosinophils (could be due to parasitic infection).

Significant other history: Benign pituitary tumor.

I believe she has some type of systemic infection that has attacked her nervous system and altered the way she perceives her sensory data. My opinion is that most likely she has a parasitic infection. My normal herbal protocols did not help her. These included very specific herbal formulas known to help the body cleanse itself from parasites. These work in approximately 90% of the cases I treat, but this was a particularly frustrating patient to help because of the lack of response to my program. We decided it was important to try the Tri-Amino and TAFA 400 Protocol. We were not sure what would happen, but I was basically out of options. She has had enough physical treatments to fix these problems if they were structural. Although the treatments do help minimize her spinal pain, it has not helped the numbness or the fatigue. She also continues to have a general sense of "not feeling right" that comes and goes. (It should be noted that she has had a benign pituitary tumor for many years but no one feels it is related to what we are working on here).

Treatment with TAFE 400 and Tri-Amino. The patient began a full course of TAFE 400 and Tri-Amino in the following manner in late winter and early spring of 2011. She started with a 30 day course of nebulizer treatments beginning with Tri-Amino for 5 days, 2x per day, mobilizing for 30-45 min. She then began using TAFE 400 in the nebulizer at a frequency of twice per day for 10 days. After that she reduced it to once per day for 30-45 minutes using TAFE 400 in the nebulizer.

She also began a course of oral administration of TAFE 400 with a dosage of 3-4 tbsp. in the morning and again in the evening. This was done over a 30-day period. (It should be noted that IV treatments started about 2/3 of the way into her use of the nebulizer and oral protocols, so there was some overlap of simultaneous use of IV, nebulizer, and oral ingestion).

Before using the IV protocols, I would say the results were marginal. There was a slight improvement but not much. She had limited success with this. She did note an increase in energy at times, but did not feel there were any significant changes.

We then began a course of IV treatments in the following manner: we used a 250 ml drip with 100 ml of TAFE 400 each treatment, with each session lasting around an hour.

After the first four IV treatments her feedback has been very positive overall. After the first IV treatment she felt very weak and light-headed, and had some nausea and chills. It was discovered that she had not eaten in the prior 5 hours, and had only taken in a small amount of water and fluids that day. She also dressed rather lightly. She had used TAFE 400 in the nebulizer earlier that day. Sessions number 2 to 4 went much better without any side effects at all, as she ate and drank more and dressed warmer, and did not use the nebulizer on the same days as the IV. She and the nurse were concerned about her low blood pressure and blood sugar after the first treatment. She has also varied the flow rate and played with that for the next 3 sessions.

The following symptomatic changes were noted after IV number 4:

The most striking change was that she has been able to feel her right big toe for the first time in at least 6-8 months. The numbness has returned, but it is starting to come back to life. She also stated that she was starting to notice more hours in the day where she felt better and more "normal". She feels something is happening and changing in her.

She has now completed 14 total IV treatments. We only doubled up on the TAFE 400 one time, but for her it seemed like it was a little too much; no significant negative affects, other than maybe some fatigue, just an overall feeling that 100 ml was a better dose for her. With 100 ml dosages she now states that she is about 80-90% improved. She is now free of all numbness in her face, and almost completely in her extremities. She does have an occasional trace of the symptoms either in the big toe, or around the mouth. However, the symptom does not last long at all, and she is back to feeling almost completely normal. She has a lot more energy and has been doing things physically that she was unable to do before. Her quality of life has significantly improved.

She has shown some signs lately that this entire condition is not completely solved. There have been some occasional bouts with GI disturbances and a feeling that she is still not totally over this. I believe that there has been a mild relapse in the parasitic infection. I believe that parasites often reside within the intestinal mucosa and there may have been some dormancy that has been activated. This would account for the occasional relapses in times of stress. We believe that another round of IV treatments using a little Tri-Amino and mostly TAFE 400 at a frequency of once per week for 8-12 weeks would be prudent to "finish the job". Even if no further improvement were to be achieved, I would still call this an extremely successful and impressive outcome when you compare her clinical picture before introducing the TAFE protocols.

One very interesting situation that recently occurred should also be noted. She was on vacation last week in North Carolina spending a lot of time boating on the lake and was in the sun all day, everyday for a week. She started the week using sunscreen but could not see any type of tanning taking place. She was hoping to get a little color so she stopped using any sunscreen at all for the last 4 days. She did not burn at all! People with her on the trip were amazed at this. She had been doing weekly IV's of TAFA 400 at this point for 2-3 weeks and taking some orally at night. She believes that she was protected from the sun by the internal ingestion of TAFA. She did not apply TAFA 400 topically on the trip. (See the photo below).

My opinion on the use of Tri-Amino and TAFA 400 for systemic infections with high eosinophils and those involving parasites, is that these formulas are incredibly powerful agents in helping the body rid itself of these infectious processes. It is totally safe without any side effects whatsoever. It must be considered as a course of therapy for non-structural causations resulting in physical manifestations of pain, numbness, malaise and fatigue.

Dr. Randall Davis, D.C., C.C.S.T.

Debra Holden: July 20, 2011 after one week in the sun and 4 days without any sunscreen.

Steven R. Schutt & John S. Everding
Gregory C. Erickson, Chairman
Luminec Corporation

Gentlemen,

Update regarding my patient Linna Tucker: Height 5'4", Weight 135 pounds, Age 50

Condition: Discoid Lupus Erythematosus

This patient has had this condition for approximately 15 years. Although the diagnosis is Discoid, I believe she shows signs of Systemic (SLE). She has a huge constellation of symptoms. The most significant include pain in the neck and back, moderate to severe fatigue, and mild to moderate lymphedema of the left foot, ankle and lower leg. She also suffers from patches of hair loss on her scalp, issues with coordination, very fragile veins, and pain in various joints. She has issues with GI and bladder, as well as the toenails. She was recently diagnosed with glaucoma. She has difficulty sleeping at times, going through cycles of waking up at 2-3 a.m. She also complains of sinus and allergy types of symptoms. She has emotional issues including depression and anxiety, mood swings, and anger. She has blurred vision. There is some tinnitus. She complains of poor memory, poor concentration, and difficulty making decisions. She gets canker sores and hives, suffers from flushing and hot flashes, as well as stiffness and limited movement in areas of her body.

Her most recent blood chemistry showed 8 positive markers for Lupus. These include positive markers for ANA in 3 categories, low lymphocytes and low WBC, plus a couple of others. She presents with pain and spasms and edema of the foot. Alternative treatment modalities have been in place for the last 2-3 years including chiropractic, myofascial release, other soft tissue modalities, lots of nutrition, high alkaline water, and acupuncture. These have helped her somewhat, but nothing has resolved her issues.

She recently started the new, modified Tri-Amino and TAFA 400 protocols. She began with 5 days of nebulizer treatments using Tri-Amino twice a day for 30-45 min. After 5 days she switched to using TAFA 400 in the nebulizer at the same dosages for a period of 10 days, then reduced treatment to once a day for 15 days. The dosage is approximately $\frac{1}{2}$ to $\frac{3}{4}$ tbsp. per application. She is on the 2nd half of that right now. She has also taken 3 tbsp. of TAFA 400 each night before bed, a probiotic in the morning on an empty stomach, and 3 tbsp. of Tri-Amino each

morning for 10 days. This was supposed to be a 30-day protocol but she was only able to take the Tri-Amino for 10 days due to lack of product. She is on the second 10 days of oral TAFA 400 and has enough to complete the 30 days.

Also, she has now started the IV portion of the protocol. This will be a dynamic process depending on how she responds. The plan for the first two weeks is to use 100 ml of Tri-Amino in 250-300 ml of saline, standard one-hour drip, to be monitored closely. This dosage will be used for the first two IV treatments. Beginning the second week we will increase the dosage to 200 ml in 300-400 ml of saline. This will be done twice that week. At that point we will assess her condition and either switch her to TAFA 400 IV or continue for 1-2 weeks with Tri-Amino. She will probably have 6-12 units of Tri-Amino IV followed by 8-15 units of TAFA 400. We will also determine the need for ongoing oral application.

She has had trouble with the first IV treatment and broke 3 needles, so the process was stopped. We then waited a week and used a 24g winged infusion needle, which went in okay, but she developed a clot with about 100 ml of solution remaining. Other than that, she felt good after the treatment. She is also on the new eye drop preparation of Tri-Amino and has reported burning in her eyes for a very short time, and then it stops. She is on medication for glaucoma as well. She has taken the Alert on occasion and noted a slight increase in energy.

Changes in condition: she has noticed a few things since starting the protocol. At times her energy was improved with less late afternoon fatigue. She has been able to significantly reduce the amount of supplements she takes without a reduction of function. She was on a product called Luparate, 9 per day, which helped keep the scalp symptoms at bay as well as a few other symptoms. She has stopped the Luparate since beginning the TAFA 400 program and has not had any relapse that would normally have occurred when that drug is discontinued. She had some days where she slept better but that is still up and down. She may be experiencing a little less pain. Overall, she appears to have a smaller list of medical complaints, but this is a broad generalization. I really expect to see a larger shift towards improved function after more IV treatments.

Also, we will now add in NatoKinase to aid with blood clotting and reduce the chance for adverse thrombolytic activity.

At this point the Tri-Amino and TAFA 400 appear to be having a slight effect, but it is early in the process. There have been no other significant adverse affects reported by the patient.

Respectfully,

A handwritten signature in black ink, appearing to read 'Dr. Randall Davis', with a stylized, flowing script.

Holistic
Medicine

July 26, 2011

Steven R. Schutt & John S. Everding
Gregory C. Erickson, Chairman
Luminec Corporation

Gentlemen,

Patient: Darlene Rubano

To summarize, this patient has a very severe constellation of symptoms and conditions that have significantly and adversely affected her health for the last 30 years. This woman is now 69 years old. She is diabetic, has chronic pain syndrome, chronic fatigue syndrome, obesity, brain fog, is always very tired, wakes up several times per night with an over-active bladder, has high blood pressure, anxiety, tinnitus, and recently broke bones in both of her feet within a few weeks of each other. She is prone to virus and sinus issues several times per year. She was on meds for ADD but we have since been able to get her off those. She is a very intelligent and pleasant woman with a beautiful family and caring husband. She is on meds for diabetes, etc.

Note: see attached history for a very thorough, first-hand explanation of her condition.

She has completed phase one of the Triamino and TAFA 400 protocol. This phase consisted of her taking Triamino in a nebulizer for 5 days, 2x per day. The dosage was approximately $\frac{1}{2}$ to $\frac{3}{4}$ tbsp. The session would last 30-45 min. She then switched to TAFA 400 in the nebulizer, same dosages, 2x per day for 10 days, then reducing to once per day for 15 days. During this time she was on a probiotic as well as other nutritional supplementation. She took the TAFA 400 orally - 3 tbsp. dosage in the morning and 3 tbsp. in the evening for 30 days. She also underwent IV infusion of the TAFA 400. She has had a total of 15 units (100 ml= 1 unit). She had 2 IV's per week and we doubled the dosage of the IV's on 3 separate occasions giving her 200 ml in 300 ml of saline.

She also used the drops in her ears and is continuing to do so. She will put 5 drops in each ear once per day, and let them "absorb" for 5-10 minutes while lying on her side. She is also using the Alert and upper respiratory formulations as needed.

The usage of the products appears to be very safe. There were two instances where she had an upset stomach after having the IV infusion. She vomited on those occasions but had no other noticeable affects. Upon further investigation, it was discovered that she had recently started a 500 calorie per day diet program (with HCG), and had eaten very little prior to the IV's. I believe that to be the cause of the reaction and we strongly recommended that she increase her caloric intake, with significant increases of protein, and she has had no reactions since. It should be noted that there does appear to be a softening affect of her veins, and the nurses have to be skilled and take this into consideration. It appears to remind them of the veins of young children which apparently are softer and more pliable.

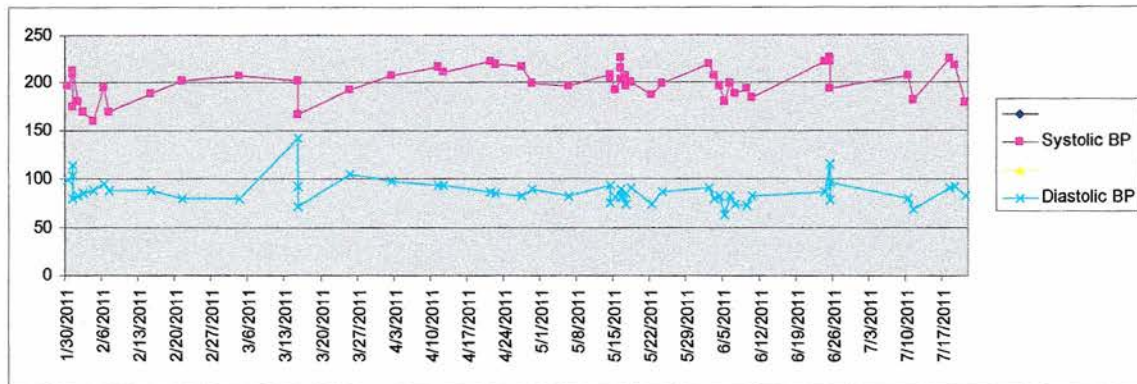

We have noticed the following changes in her condition:

- Her energy is up about 10-20 %;
- Her brain fog has decreased about 10-20%;
- Her blood pressure is stabilizing as far as the diastolic numbers.

Prior to beginning the TAFE 400 program, she had gone through numerous meds to combat the HBP, but the side effects were not acceptable and the numbers didn't really change much anyway, and sometimes even worsened. Before the TAFE 400 program, her original numbers were in the neighborhood of 210-230 over 100-130. It has really jumped all over the place in the last several months. Last week when I checked her BP it was 178/82. It is still jumping around but more often the diastolic is in a very comfortable range [see graph below]. There has been no appreciable change in her weight loss.

Comments: It should be noted that due to logistical issues, the three main components of the protocol were not administered concurrently. The nebulizer program was interrupted after about 2 weeks due to malfunctioning of the machine. There was about a 1-2 week break in the middle so that was protracted and interrupted. The oral portion was started at the same time as the nebulizer, but the IV treatments were not able to commence until about 3 months after starting the oral and nebulizer. It is not known how the outcome would have been if everything was done concurrently, giving the body a larger saturation. I believe we have seen evidence of detoxification and she has had at least 2 viral infections while under going these treatments. I believe this to be part of detoxing. She will have sores in the nose, or cracked skin on the fingers, sinus congestion and raspy voice. Her immune system is slow to react to these and takes longer for her to heal than most people.

Phase two is beginning with a new protocol of Tri-Amino - 3 tbsp. orally each morning, and TAFE 400 - 3 tbsp. orally each evening. This will be a 30-day program of oral application and a probiotic is to be taken on an empty stomach each morning. She will also undergo 5 weeks of Tri-Amino IV treatments only 2x per week using 200 ml per IV of the Tri-Amino beginning on week 2 of these new IV treatments. We are continuing the eardrops. (There has been no change in the tinnitus thus far). We will than re-assess the need for further TAFE 400 IV treatments. This will give us a chance to see how the IV and the oral program in harmony will affect her outcome.

Respectfully,

Dr Randall Davis, D.C., C.C.S.T.

**Patient History: Darlene Rubano
January, 2011**

Age: 68
Weight: 238 lbs.
Height: 5 ft. 3 in.
Recent BP: 154/94. (On 12/30 it was 165/90).

Medication

Insulin called Humulin N, exactly 50 units per day, and Humulin R., approx. 50 units per day.

Exercise

I don't exercise on a regular basis because at times it causes a relapse of Chronic Fatigue Syndrome symptoms. I go to physical therapy twice a week for my neck and shoulder problem. I also do physical therapy exercises at home that consist of stretching and isometrics for the neck and shoulder.

Digestion

No problems with digestion. Bowel movements are normal and regular each morning.

Alcohol and tobacco use

I gave up smoking in 1992.
I have red wine on infrequent occasions.

Water consumption

Approx. $\frac{3}{4}$ gallon to 1 gallon per day. Additional liquids: Zevia, a diet root beer sweetened with Stevia, about 24 ounces per day; Organic decaf coffee with a drop of cream sweetened with Stevia, about 30 ounces per day.

Diet

Foods are mostly low fat, low carb, low calorie and organic.

- *Breakfast:* Low carb protein bread (12 grams of protein per slice), one slice with sugar free jelly or preserves. Organic decaf. Two or three times a month I may have eggs and a slice of bacon.
- *Snack:* Atkins low carb shake or an orange. I don't snack every day.
- *Lunch:* One slice of low carb protein bread, 4 ounces meat, and one can of Zevia. Occasionally I have a pickle or $\frac{1}{2}$ tomato.
- *Snack:* A couple of ounces of nuts such as organic walnuts or almonds.
- *Dinner:* 4 ounces meat, 2 cups of salad consisting of various lettuces (no iceberg) with roasted garlic cloves, tomato, sometimes a few olives, and low fat balsamic vinegar dressing, plus decaf coffee; occasionally a vegetable.

Health conditions

Chronic Fatigue and Immune Deficiency Syndrome. Symptoms include fatigue, brain fog (cognitive problems), depression, unaccountable weight loss or gain, muscle weakness, and pain. These are always present and worsen during a relapse. During a relapse it is very difficult, or at times impossible, to function. I use supplements to treat mild depression, which comes and goes.

Physical, mental, and/or emotional stress can cause a relapse. Certain exercises including aerobic and muscle strengthening cause a relapse. It is difficult to know how active I can be without

causing a relapse. I usually find out the hard way. I feel buried alive under this ailment. I wish I could feel normal again, even for a little while before I drop off of the twig.

Diabetes - Type 2

Since about 1998.

High Blood Pressure

Unable to take meds for it. Meds I tried made it worse and side effects were unbearable.

Sensitivity to electromagnetic fields

Exposure causes a relapse. I use devices to shield myself. Dr. Goldstein said this sensitivity was typical in all his CFS patients.

Sleep apnea when I lie on my back

I use a device to keep me positioned on my side while I sleep.

Tinnitus

It seems worse in my right ear. I have had this for decades.

Sensitivity to light and/or sound at times

Low back pain

Worse in the morning. Could be piriformis muscle syndrome.

Stiff and painful joints

Right knee not completely trustworthy especially when descending the stairs.

Bunions are forming on both feet

I wear prescription orthotics and sensible shoes.

Pain and limited mobility in neck and left shoulder

Unable to turn head to the left to a normal degree. Unable to raise left arm above shoulder level. Presently going to physical therapy. Sessions that included muscle strengthening exercises caused a relapse that lasted for 3 or 4 days. This happened on more than one occasion. I requested a change in the program to include only stretching and isometrics which don't seem to cause relapses.

Unable to lose weight

"Unaccountable weight gain or loss" and inability to lose weight are symptoms of Chronic Fatigue Syndrome. Dr. Jay A. Goldstein, who was my doctor until he retired, describes this in his book, Chronic Fatigue Syndromes: The Limbic Hypothesis.

I understand that part of this problem is a lack of exercise.

Fluid corneas

When I read or do other close work, my eyelids put pressure on my corneas which is normal for everyone. However, since my corneas are "fluid", they flex or warp under the pressure. This causes me to have double vision that lasts for hours.

Weak muscles, especially in the legs

I am able to walk for only 7 to 10 consecutive minutes before needing to rest. Climbing the stairs in my home is very difficult at times.

Frequent urination

I awaken every 1-1/2 to 2 hours each night to urinate. Frequency occurs during the day as well.

Seborrheic dermatitis

Scalp and forehead are affected.

Chemical sensitivities

This includes exposure to airborne chemicals and prescription medications. Side effects make many meds impossible for me to take. Some meds have the opposite effect on me. A blood pressure med caused my BP to go higher.

Notes on Chronic Fatigue and Immune Deficiency Syndrome

Dr. Jay A. Goldstein was my doctor until he retired. He researched CFS for more than 12 years and wrote four books on the subject. I don't think anyone knows more about it than he does. His theory is that the source of the problem is in the limbic system. If TAFA is going to remedy CFS, my thinking is that it will have to get deep into the brain.

Update regarding patient Alex Beecher
Age 12

Condition: Warts located on palm, middle finger and thumb.

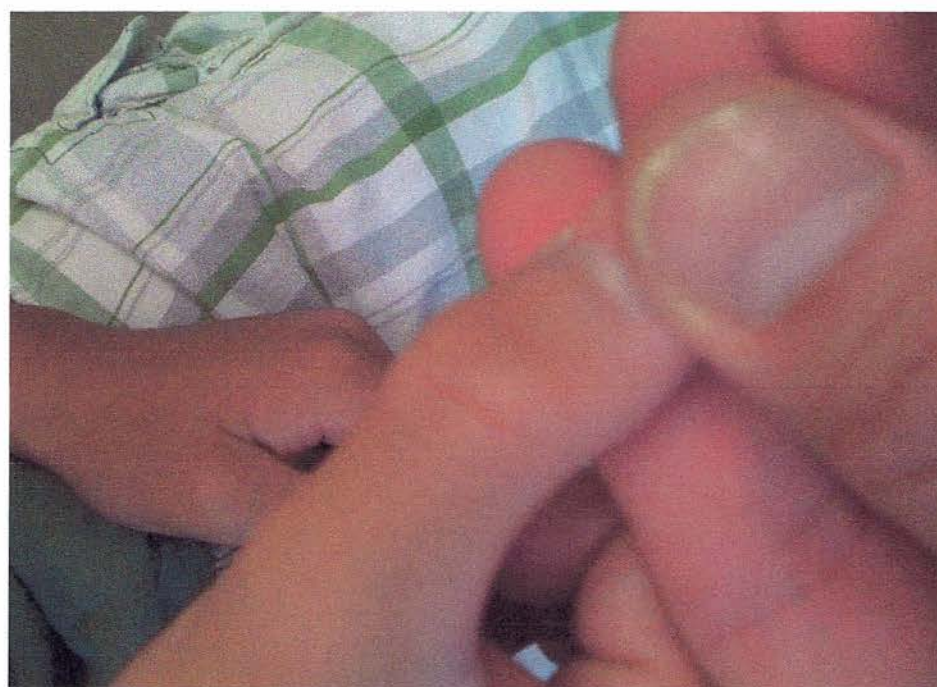

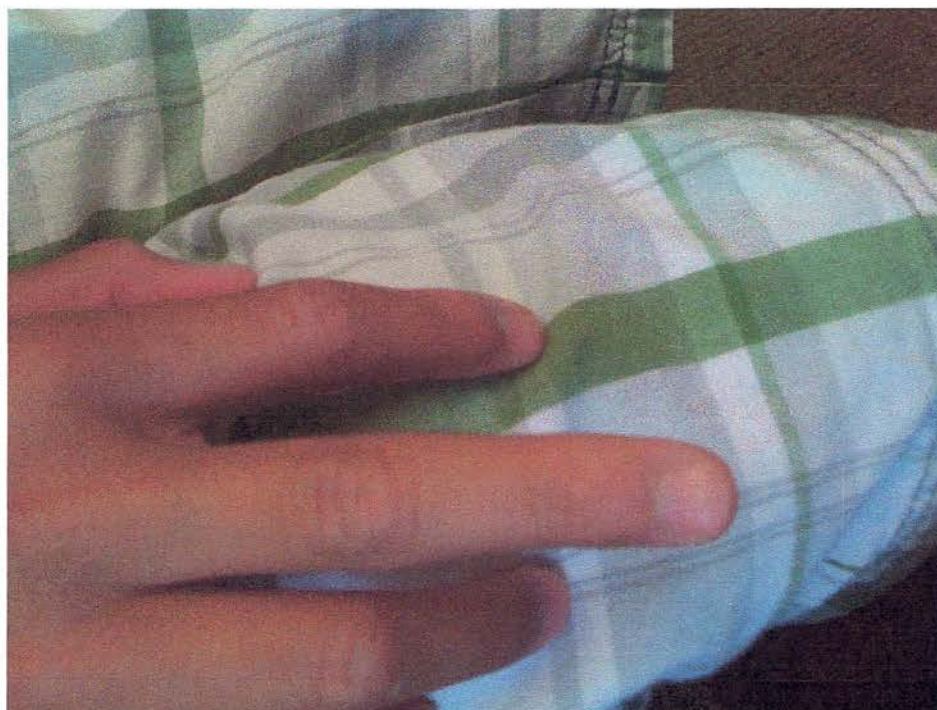

Patient was treated topically with TAFA 400 once or twice daily and on some days only once. Small amounts of TAFA were used, just enough to saturate the tissues. Patient used a total of approximately 10-15 ml of solution. No other treatments were offered during the TAFA 400 protocol.

The post treatment pictures now represent about 10 weeks of treatment. I estimate the condition to be 90%-100% improved. We have discontinued the topical application and he has had no reactions or side effects of any type.

Note: The 3 pictures below were taken on 7/20/11

The patient and his father are extremely happy and impressed with the results. In fact, his father is now using TAFA 400 for his athlete's foot and is also seeing results.

My opinion is that TAFA 400 is an excellent product for healing warts and is totally safe.

Respectfully,

Luminec Corporation

Gentlemen,

This letter is in reference to my patient, David Langley, age 9. He is of normal height and weight for his age. His condition: Athletes foot (fungus)

The boy had been suffering with this condition for approximately 6-9 months. He was given a small amount of TAFE 400 solution to be applied one to two times per day (topically only). Within 2 weeks of the first application his condition had been resolved. Please see the letter from his mother below:

Dear Dr. Davis,

Thank you so much for recommending TAFE for my son's athlete's foot. He had it for over 6 months and I tried everything to get rid of it to no avail. Once we started the TAFE, the fungus was gone in 2 weeks and has not come back. I am so impressed. Thank You, Thank You, Thank You!

Sincerely,

Leslie Langley

It is readily apparent that the TAFE 400 is an excellent product to resolve athletes' foot.

I believe the above letter speaks for itself.

Respectfully,

A handwritten signature in black ink, appearing to read "Dr. Randall E. Davis".

Pasha (cat) TAFA 400
Restore Health

Daisy, (dog) Champion Maltese TAFA400
Incurable Skin Disease

Testimonial on Darlene's cat Pasha 7-26-11

Pasha is my Bombay cat, all black with gold colored eyes. He is very sleek and looks like a miniature black panther. He is affectionate, smart, and likes to cuddle. The normal life expectancy of a Bombay is 13 to 15 years and Pasha is now 13 years old.

I feed him 5 drops of TAFE 400 on a teaspoon size lump of Newman's Own Organic Cat Food. The primary change in Pasha since I began giving him TAFE 400 is the size of his appetite.

He used to be satisfied with 1 cup per day of dry cat food (formulated for senior cats). I now divide his food into 2 scoops of 1/2 cup each. My husband gives him part of one scoop about 5 or 6 in the morning and I give him the rest of it a little at a time as the day goes by. I give him part of the second scoop about 6 p.m. and the rest about 10 p.m. I found that if I give him the whole scoop at once he would gobble it up fairly quickly and have nothing to snack on later in the day. Sometimes he would throw up from eating too fast or too much at one time.

Since he has been on the TAFE 400 he needs 3 scoops (1-1/2 cups) to get him through the day. He would eat more if I let him, but I won't because I don't want him to get fat. He isn't as active as he was when he was younger and could easily gain too much weight.

A couple of times per week Pasha will invite me to play. He did this more often when he was young. He will scamper around and chase a laser dot or try to catch toys that we play with. He doesn't play for as long a time as when he was young, but before the TAFE 400 he wasn't inviting me to play at all. When he was young he used to "hang out" with me before going to the couch for his main nap at noon. Then he stopped doing that. Now, since taking TAFE 400 maybe once or twice a week, he likes to "hang out" with me. He sits on the chair next to me at the kitchen table and helps me with the crossword puzzle.

He doesn't sleep through the night. He never has. He gets up around 4 or 5 in the morning to stand guard at the front window. The early morning hours are when small woodland creatures begin to prowl around searching for food. We have seen raccoons, opossums, skunks, and the neighbor's cat in the area. I can tell if Pasha has been doing battle at the front window by the number of flowerpots that are knocked over. He is a very brave watch-cat and he takes his job seriously. Although I have tried, I have not been successful in getting him to turn his days and nights around a little so that he might spend more time awake with us during the day. I am proud of him, and I am happy to report that we have never been invaded by a single woodland creature. Not once.

Our testimonial on using TAFE 400 to treat our champion stock Maltese - Daisy

The beautiful Daisy

Dear John,

Thank you so much for sending us the extra TAFE 400 to use in Daisy's treatment! She started her treatment program on Wednesday, May 18, 2011. We followed the recommendations and suggestions given us by you and Steven, using half an eye dropper of TAFE 400 in her water bowl twice a day for one week. Placing the drops in her water has really worked out well since she loves to drink water all day.

Daisy before her hair loss problem began

Daisy's Background:

About a year and a half ago, Daisy's beautiful coat began to thin out starting from the top of her neck area down to the very top of her back and down both sides to her belly. Her tail and behind her rear legs were also affected. Her skin pigment in these affected areas had turned to a shade of dark purple while the rest of her skin remained a healthy light pink color in the unaffected areas. We had taken Daisy to many different veterinarians in the hopes of resolving whatever was causing this disfigurement on her body. The most recent vet we took her to subjected Daisy to several tests, then told us she would require additional testing and possibly even surgery that would have to be performed by a different veterinarian who specialized in the types of skin conditions Daisy was suffering from.

We were cautioned not to get too optimistic about any improvement in Daisy's condition because the only known treatment for what she had could be very hard on her entire system, and in many cases this type of surgery had resulted in more harm to the dog's health. The vet also mentioned that we wouldn't feel uncomfortable in the waiting room at the new vet specialist since all of the owners we'd meet would have dogs with the same illness, and in some advanced cases the dogs would be probably be hairless. We were devastated, and after turning to every vet we could find that might help her, Daisy's situation seemed hopeless.

Daisy's thinning hair with the dark colored skin showing through

Current update after we started Daisy's TAFE 400 treatment program on May 20,2011:

Per the advice from you and Steven, on May 25, 2011 we moved to the next level of treatment using a lower dosage of half an eye dropper of TAFE 400 once a day for two weeks. Almost immediately we were able to see small spots and patches of healthy light pink pigment appearing within the dark purple pigmented areas. It appeared that the TAFE 400 was attacking the

areas of darker pigment. Daisy's treatment with TAFE 400 has continued through today, May 27, 2011 and the return of the pink pigment is truly amazing. Every day Daisy's progress continues to improve.

Areas on Daisy's back are starting to return to their former healthy color and peach fuzz type hair is growing back growing

We will keep you updated on Daisy's exciting progress!

Sincerely,

Bill and Beverly

P.S. Beverly and I are also using the TAFE 400 everyday with incredible results! Would it be possible to obtain some additional TAFE 400?

July 21, 2011

Dear Steven and John,

I am a medical doctor and one of my specialties is diabetes. I have personally suffered from diabetes for many years but have managed to keep my blood sugar readings within acceptable levels due to my knowledge of medications. It has, however, been a continual juggling act and I developed several side effects from these medications.

Four years ago, Dr. Yasny suggested I begin a dietary and supplement program. Since then, I no longer take medications for my diabetes and I have successfully recouped from the side effects acquired during years of taking these medications. With diet and supplements alone, my fasting blood sugar level was approximately 112; as I'm sure you know, this is considered high. The normal range levels should be between 80 and 99. Although my hemoglobin A-1 C levels were within the reference range, they were not ideal. Being able to stop taking my diabetes medications, healing from their side effects, and having a relatively stable blood sugar level, I was able to quit worrying so much about my diabetes. And now, during the past six weeks that I have been using your TAFA 400 product, I have noticed some very interesting changes in my health; my fasting blood sugar levels are approximately 90. I consider this perfect, and close to what it was when I was 16. The TAFA 400 has piqued my interest to say the least! As an expert in blood sugar issues, I have treated thousands of people and am keenly aware that type II diabetes is a fast-growing epidemic. I look forward to the day when I can recommend these products to my patients!

To be fair, I must tell you that there have been some side effects with the TAFA 400 as well. I now sleep better, I have more energy, my skin looks better, and my hair is thicker. At 5 foot one inch tall, I wish I could tell you I had also grown an extra inch. Wouldn't it be great if this happened because I continued to take the TAFA!

I applaud your efforts as a scientist Steven, and I look forward to utilizing your products for all my patients! And thank you John, for establishing the Luminec organization so that billions of people will be able to benefit from these amazing products - and I'm not exaggerating - Billions!

Thank you all!

Radha Gattu, M.D.

Dear John,

Just wanted to write and tell you how happy I am with the Tafa Shampoo.

I have been using this fine product for about four months now, and can tell you that I like it so much, that I'll be using it for the rest of my life. I'm that impressed!

I have noticed that my hair is now almost twice as full in volume after it dries and that it feels silky smooth and soft as a further benefit. Best of all, it's all-natural with no harsh chemicals or additives.

As you know, I own Dogshealth.com, a company that manufactures and distributes holistic health products for dogs. I can't wait to try the animal version of this shampoo on some of the dogs in our offices. I'm sure the results will be just as dramatic for them as I have seen for myself.

Thank you ever so much for sending me samples.
